

(a) Centroid-star (current)

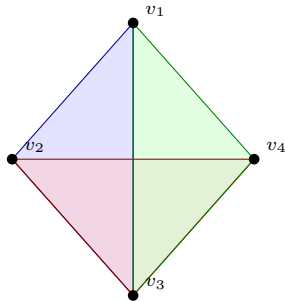

3-prong spokes meeting at a hyperedge centroid

- 3 vertices + centroid + 3 spokes/edge
- readable for small $|E|$, busy for $|E| \gg 50$
- rotationally symmetric on the 3 inputs

(b) Filled-triangle

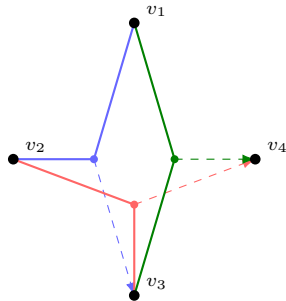

hyperedge = filled translucent triangle

- each hyperedge = one filled face
- ternary "face" topology visually obvious
- overlapping faces colour-mix at shared vertices

(c) Ordered-slot

distinguish slot 1, 2, 3 of (v_1, v_2, v_3)

- solid lines = operator inputs (slot 1, 2)
- dashed arrow = output slot (slot 3)
- encodes binary-op + ternary-routing distinction
